The Sackler Faculty of Medicine

The Sackler Faculty of Medicine is Israel's largest medical research and training complex. The Sackler Faculty of Medicine of Tel Aviv University (TAU) was founded in 1964 following the generous contributions of renowned U.S. doctors and philanthropists Raymond, and the late Mortimer and Arthur Sackler. Research at the Sackler Faculty of Medicine is multidisciplinary, as scientists and clinicians combine efforts in basic and translational research. Research is conducted in the laboratories on the TAU campus, and in the clinical facilities affiliated to the Faculty. The Faculty of Medicine includes the Sackler School of Medicine, the School of Health Professions, the School of Public Health, and the School of Dental Medicine. Education takes place in all these schools and in the Graduate School of Medicine, School of Continuing Medical Education, the New York State American Program and the B.Sc. Program in Medical Life Sciences. This network of preclinical and clinical teams helps realize the ultimate goals of the research: the basic understanding of human pathophysiology and the prevention, diagnosis and treatment of disease. The research of clinical faculty members from the Sackler School of Medicine are featured in this research brochure.

The Faculty of Medicine engages in joint teaching and research programs with nearly every faculty at TAU, including the Wise Faculty of Life Sciences, the Sagol School of Neuroscience, the Edmond J. Safra Bioinformatics Center, the TAU Center for Nanoscience and Nanotechnology, and the Edmond J. Safra Center for Ethics, and multi-nationally with schools, hospitals and research centers throughout the world. The Sackler faculty is known for research in the following areas: cancer biology, stem cells, diabetes, neurodegenerative diseases, infectious diseases and genetic diseases, including but not limited to Alzheimer's disease, Parkinson's disease and HIV/AIDS. Physicians in 181 Sacker affiliated departments and institutes in 17 hospitals hold academic appointments at TAU. The Gitter-Smolarz Life Sciences and Medicine Library serves students and staff and is the center of a consortium of 15 hospital libraries.

The student body is made up of 750 Israeli students enrolled in the 6-year M.D. degree program, 300 American and Canadian students enrolled in a 4-year M.D. program chartered by the State of New York and accredited by the State of Israel, and a 4-year program for Israeli students for the M.D. degree, with 260 students. Approximately 200 students study dental medicine in a six-year program where they are awarded the D.M.D. degree and another 2,000 students are enrolled in the health professions programs where they will earn degrees in Communications Disorders, Nursing, Physical Therapy and Occupational Therapy. Sackler's Graduate School for Advanced Studies trains approximately 800 masters and doctoral level students in the biomedical disciplines, with a special emphasis on a multidisciplinary approach and application of fundamental knowledge to important biomedical problems.

The Sackler Faculty of Medicine is led by the Dean, Professor Ehud Grossman; Vice Deans Prof. Karen Avraham, Prof. Iris Barshack, Prof. Moshe Phillip, Prof. Anat Lowenstein, Prof. Meir Lahav, Prof. Ami Fishman and Prof. Moshe Kotler.
## Table of Contents

### Cancer
- Prof. Nadir Arber, M.D., M.Sc., MHA
- Dr. Shiran Shapira, Ph.D.
- Prof. Iris Barshack, M.D.
- Dr. Yair Herishanu, M.D.
- Prof. Shai Izraeli, M.D.
- Dr. Yehudit Birger, Ph.D.
- Dr. Guy Lahat, M.D.
- Dr. Yaacov Richard Lawrence, MBBS, MA, MRCP
- Dr. Uri Amit, M.D., Ph.D.
- Dr. Raya Leibowitz-Amit, M.D, Ph.D.
- Prof. Pia Raanani, M.D.
- Dr. Galit Granot, Ph.D.
- Prof. Amos Toren, M.D., Ph.D.

### Cardiovascular System
- Prof. Ehud Grossman, M.D.
- Dr. Avshalom Leibowitz, M.D.
- Prof. Giris Jacob, M.D., D.Sc.
- Prof. Dror Harats, M.D.
- Prof. Gad Keren, M.D.

- Head, Djerassi Oncology Center
- Former head, Cancer Research Center, Tel Aviv University
- Former head, Dotan Center for Hemato-oncology, Tel Aviv University

**Research**

**Laboratory of Molecular Biology – ICPC**

The Integrated Cancer Prevention Center (ICPC) has diverse and broad experience in translational research focused on early detection, prevention and therapy of cancer, particularly in tumors of the gastrointestinal (GI) tract. The team is highly experienced in clinical studies, molecular epidemiology as well as in molecular and cell biology studies of cancer.

Currently, on-going researches at the ICPC focus on translational research, bridging between basic researches in the lab and clinicians and patients in the clinical center. The center has a long history of planning, developing, and conducting clinical trials, with a main focus on investigator-initiated and cooperative group trials investigating the activity of drugs for the prevention and treatment of colorectal cancer (CRC).

Basic research takes place at the Laboratory of Molecular Biology, headed by Dr. Shiran Shapira, a senior scientist and member of the academic staff at Tel Aviv University. Dr. Shapira devotes herself to cancer research in the fields of early detection, prevention, and cancer therapy. She possesses extensive experience in wide range of biology areas.
with focusing on cancer research, biochemistry, molecular biology, signal transduction, antibody engineering, protein expression and purification and gene delivery.

**Research Team**

Prof. Nadir Arber, MD, MSc, MHA, Head of ICPC; Dr. Shiran Shapira, PhD, Head of Laboratory; Dina Kazanov, MSc; Dr. Eliezer Liberman, MD; Ilana Bostenai, PhD student; Ahmad Fokra, PhD student; Sally Zigdon, MSc; Lina Tiklan

**Projects**

1. Early detection – development of new methods for the early detection of CRC and colorectal adenomas as well as other types of solid and hematological cancers. The tested samples taken from humans, blood and urine.

2. Prevention – Serving as the PI of several international, multicenter trials in the prevention of GI tumors, and in particular sporadic and familial CRC

3. Identifying high risk subjects through molecular epidemiology – We have identified a new polymorphism in the APC gene (E1317Q), which is more common in Sephardic Jews and Arabs and is associated with a HR of ~4. When it is combined with another polymorphisms in the CD24 gene (V248A) the OR is 7.8.

4. Detection of new oncogenes that play a role in the multistep process of CRC carcinogenesis.

The research team at the Laboratory of Molecular Biology has been exploring, for several years, the hypothesis that CD24 is a potential oncogene in GI malignancies and may serve as a biomarker and target for the treatment of cancer and cancer-related chronic inflammatory disorders such as, inflammatory bowel diseases (IBD).

5. Treatment - Development of novel therapeutic strategies for cancer treatment with a main focus on immunotherapy using humanized anti-CD24 monoclonal Abs, immunotoxin and bi-specific

6. Design of novel therapeutic agents targeting Ras and Wnt pathways that play an important role in GI carcinogenesis, based on gene therapy using adenoviruses and highly sophisticated viral vectors such as adenoviruses, lentiviruses and adeno-associated viruses.

7. Wound healing- CD24 may represent a novel clinical intervention strategy to accelerate the healing of wounds both acute and chronic injuries for patients. The proposed treatment may enable faster recovery from injuries while reducing the risk of infection, toxicity and other possible side effects.

Investigating Markers of Inflammation and of Neoplastic Processes for Diagnosis and Treatment

Positions
Professor of Pathology
Vice Dean, Head of School of Medicine, Sackler Faculty of Medicine, Tel Aviv University
Head, Department of Pathology
Co-director, Tumor Tissue Bank, Molecular Diagnostic Service, Precision Medicine Project (diagnostic service), Digital Pathology Project, Sheba Medical Center, Tel Hashomer

Research
The profession of Pathology encompasses three main constituents: diagnostics, teaching and research. Within the department, description, processing and examination of the macroscopic specimen is performed by the doctors of the department. The specimens undergo histochemical staining. If necessary for the sake of diagnosis, additional specialized histochemical and immunohistochemical stains are carried out. Furthermore, the department executes other techniques that enable precise diagnosis such as: FISH, PCR, In-situ hybridization and Electron Microscopy visualization. The department delves in a large array of research projects with the cooperation of other departments within and outside of the hospital, and intrinsic research of the department itself.

The department encompasses a laboratory specific for histochemical staining, a laboratory for immunohistochemical staining that performs in-situ hybridization, as well as a laboratory for PCR, Electron Microscopy, FISH and for Molecular Pathology. Moreover, we are leading the tumor tissue bank of the Sheba Medical Center, and the Molecular Diagnostic Service of the Sheba Medical Center, using an advanced NGS platform for diagnostic and research purposes. We also perform on a routine and research basis immunohistochemical stainings and molecular methods for precision medicine and immunotherapy. Furthermore, the department includes an advanced system for photographing and processing both macroscopic and microscopic constituents, and leads the Digital Pathology Project of the Sheba medical Center.

Another branch is that of independent research. One of the great accomplishments has been the conceptual implementation of the use of microRNAs to aid in the identification of different tissues and the application of this knowledge to identify metastases of unknown origin. In situ hybridization of microRNAs is an important methodology used in our research for studying the pathogenesis of inflammatory and of neoplastic processes. Another area of research in which the department is leading is the development of the technology of tissue microarrays. The department leads the investigation of inflammatory processes and lymphoproliferative tumors according to the production and study of heavy chain B lymphocytes within the tissue. In light of this investigation, the department received a number of important research grants.

Investigating the Microenvironment Interactions and B-cell Receptor Signaling in Chronic Lymphocytic Leukemia

Positions
Senior Lecturer, Sackler Faculty of Medicine
Head, CLL Service, Tel Aviv Sourasky Medical Center
Secretary, Israeli CLL Study Group
Committee Member, Israel Society of Hematology

Research
We study interactions between the CLL cells and the tissue microenvironment and explore new aspects of the B-cell receptor (BCR) signaling in CLL cells. Our previous work characterized distinct in vivo gene expression signatures of CLL cells derived from the different compartments of blood, bone marrow and lymph nodes. Recently, we have shown that SLP76, an adaptor protein of the T-cell receptor pathway, is ectopically expressed in CLL cells and mediates alternative signaling downstream of the BCR (Figure). Our research is aimed to discover novel targets of therapy of CLL. Our group is well experienced in performing cell biology assays, flow cytometry and image analysis, protein analysis and gene silencing in primary CLL cells, and is highly skillful in studying signaling in CLL cells.

Basic and Translational and Research of Childhood Malignancies and Leukemia

Positions
Professor, Sackler Faculty of Medicine
Chair, MD-PhD program

Research
We focus on patient-driven basic research into the pathogenesis of childhood leukemia and cancer. We harness advanced molecular and cellular biology technologies utilizing in-vitro and in-vivo models with the ultimate goal of improving the care of children with cancer.

Our research is divided into two major topics:
1. Basic, translational and clinical research of leukemia.
2. The role of SIL (STIL) protein in mitosis, centrosomal biology and cancer.

Cancer is the deadliest disease of children and leukemia is the most common childhood cancer.

Carboxypeptidase E (CPE), a novel Wnt inhibitor, is excluded from the colonic crypt bottom.
We are interested in the fundamental question how normal blood development is diverted into leukemia. What are the genetic and biochemical abnormalities that block cell differentiation, enhance proliferation and survival and confer the unique stem cell properties of self renewal to leukemia stem cells? We focus on chromosome 21 because of the mysterious association of leukemia with Down Syndrome. We utilize advanced genomic technologies, cell based assays of transformation of primary human and mouse stem cells, mouse models including transgenic, transplantation and explants of human leukemia. Our recent discoveries of the major involvement of the TSLP-IL7R-JAK2 pathway in leukemogenesis have lead to clinical trials with novel inhibitors of this pathway for high-risk leukemias in children and adults. The spread of leukemia to the brain is a major clinical problem as preventive therapy to the brain consisting of chemotherapy or irradiation causes long term side effects. We are therefore studying how leukemia cells spread to the central nervous system and developing mouse models to study this challenging problem.

We have discovered that SIL, a gene cloned from childhood leukemia, is required for centrosomal biogenesis and for survival of cancer cells. Targeting SIL by siRNA cause cancer cell death at mitotic entry in-vitro and in-vivo. Current research focuses on the fundamental role of the SIL protein in centrosome generation in normal and malignant cells and on developing approaches for its targeting for cancer therapy.

Tumor-Microenvironment Cellular Interactions in Cancer Progression and Metastasis

Dr. Guy Lahat, M.D.
Division of Surgery
Tel Aviv Sourasky Medical Center
Sackler Faculty of Medicine
guyla@tlvmc.gov.il

Research

The surgical oncology research lab was established in order to conduct clinical and basic science research in order to further understand disease patterns and mechanisms, thus, trying to improve diagnosis and treatment outcomes of the patients we operate on. Moreover, the lab is a platform for the development of future academic surgeons, passionate about both research and the field of surgery. We focus on patient-driven translational research, studying the molecular basis of various soft tissue sarcoma (STS) tumors, and gastrointestinal malignancies. We aim to explore distinct signaling pathways and molecules that may play a role in cancer progression and metastasis. Specifically, we investigate the cross talk between metastatic GI cancer cells and the omentum. We also investigate the potential role of miRNAs as molecular biomarkers for staging, prognosis, and pattern of future spread. For these purposes we frequently utilize in-vitro and in-vivo models, human cancer specimens from our clinically annotated tissue bank, as well as various advanced molecular and bioinformatic approaches.

Tumor growth is promoted by omental fat in vivo. PANC-1 pancreatic cancer cells were initially pretreated in vitro with human omental fat conditioned medium (CM) or control regular medium (RM) for 24h. The tumor cells were then injected subcutaneously into the flank of nude mice. (A) Tumor growth and weight of PANC-1 tumors was facilitated in mice following pre-treatment with omental fat CM (n=15); (B) Representative mice and tumor images; (C) Marked increase in proliferation (Ki-67) and microvessel density (CD31) by human omental fat CM.
Uptake of omental fat exosomes by cancer cells. PKH67-labeled omental fat exosomes were incubated with PANC-1 pancreatic cancer cells (upper panel) and AGS gastric cancer cells (lower panel), reaction was stopped at different time points (1, 3, 5 and 7 hours) and cells were analyzed by confocal microscopy. The nucleus of PANC-1 and AGS cells was stained with dapi. Negative control- PANC-1 and AGS cells with no addition of labeled exosomes.

Radiation Biology: Translating Biological Insights from the Lab to Impact Cancer Patient Care

**Positions (Dr. Lawrence)**
- Director, Center for Translational Research in Radiation Oncology
- Senior Lecturer (regular track), Sackler Faculty of Medicine
- Assistant Professor (adjunct), Dep. Radiation Oncology, Thomas Jefferson University

**Research**
Radiation therapy is a cornerstone of modern cancer care. Ionizing radiation kills cancer cells by generating reactive oxygen species, damaging DNA, and inducing chromosomal damage. Yet many aspects of radiation biology remain unknown. The lab focusses on understating cells’ ability to survive ionizing radiation, a phenomenon known
as radioresistance. We seek to answer the question of how some tumors are able to withstand very large doses of radiation. We hypothesize that cells withstand the intense onslaught of DNA damage by adapting their metabolic processes, diverting biosynthesis pathways to nucleotide synthesis and REDOX management. Another explanation of why cells in-vivo appear to resist radiation is the result of the interaction between tumor cells and the microenvironment. Ongoing projects in the lab are challenging and developing both these concepts.

The research center also performs clinical research, initiating and running clinical trials. Hence, a particular strength of the lab is the ability for our findings to impact patient care through the performance of clinical trials.

miRNAs in Solid Malignancies / Immunotherapy Research / Clinical Cancer Research

Positions
Senior Lecturer, Sackler Faculty of Medicine
Senior Medical Oncologist, Clinician-investigator, Oncology Institute & Cancer Research Center, Sheba Medical Center, Tel Hashomer

Research
As a clinician-investigator and a practicing medical oncologist, our lab is engaged in basic, translational and clinical cancer research.

Basic research: Our lab at the Cancer Research Center at the Sheba campus studies the role of microRNAs in solid malignancies. We were the first to show that a large miRNA cluster on chromosome 14q32 is silenced in melanoma. This cluster was later dubbed ‘the larger tumor suppressor miRNA cluster’ and was shown to be down-regulated in a wide range of malignancies. We showed the involvement of three miRNAs from this cluster in melanoma progression, and continue to study the role of this cluster in the pathogenesis of this disease. In the last year, we have also studied the involvement of miRNAs in bladder cancer; specifically, preliminary results suggest that a family of miRNAs are associated with the development of resistance to chemotherapy in bladder cancer; research is currently ongoing.

Translational research: Immunotherapy, namely the activation of the immune system against cancer, is revolutionizing cancer treatment, yet not all cancers, and not all patients within a given cancer, respond to immunotherapy. Currently, the biomarkers associated with response to immunotherapy are unknown. In collaboration with Dr. Irit Gat-Viks from the Faculty of Life Sciences at TAU, we are embarking on a clinical trial in which we will prospectively search for immune cell populations within the systemic circulation that are associated with response to immunotherapy. We will perform RNA sequencing of immune cells before and following immunotherapy treatment and analyze the cell populations using deconvolution algorithms developed at the Gat-Viks lab.

Clinical research: Whereas the list of anti-neoplastic treatments is constantly growing across the cancer spectrum, currently there are almost no proven predictive biomarkers of response to treatment with any of these agents, and clinical decisions are generally empirical and based on ‘trial and error’. We are interested in finding associations between lab variables/plasma biomarkers and response to anti-neoplastic treatment in genito-urinary malignancies; specifically, we recently addressed the following clinical questions:
1. We described clinical and laboratory variables associated with response to the hormonal agent abiraterone in prostate cancer.
2. We showed that the neutrophil-lymphocyte ratio is associated with response to chemotherapy in bladder cancer, and that a high lymphocyte count is associated with pathological complete response at cystectomy following neo-adjuvant treatment.
3. We described the patterns of change of several plasma biomarkers following treatment with the biological agent cabozantinib in prostate cancer.
4. We summarized our clinical experience with the immunotherapeutic anti-PD1 antibody pembrolizumab, showing that low lymphocyte counts are associated with lack of response.

These clinical works, taken together, show that the adaptive arm of the immune response is imperative in amounting response to both chemo and immunotherapy.

Hematological Malignancies

Positions
Prof. Raanani, Clinical Full Professor in Hematology, Sackler Faculty of Medicine

Research
Our primary field of interest is finding new therapies or better therapies for the treatment of incurable hematological malignancies. Our projects focus on exploring the effect of new agents on different leukemia and lymphoma cell lines and patient samples. We study the molecular pathways involved in the initiation and maintenance of hematological tumorigenesis and try to understand the effect of the different agents on these molecular pathways. We apply cutting-edge technologies including, molecular protein and cellular biology, microarray and NGS analysis. Understanding normal hematological development and understanding the molecular effect of different chromosomal abnormalities.

Deferasirox is a rationally-designed oral iron chelator used to reduce chronic iron overload in patients who receive long-term blood transfusions. We showed that this agent can induce apoptosis in mantle cell lymphoma.
(translocations, deletion, etc.) is essential for understanding the processes leading to the induction and maintenance of hematological malignancies and for designing targeted treatments for these malignancies.

Positions (Prof. Grossman)
Head, Internal Medicine D and Hypertension Unit, Chaim Sheba Medical Center, Tel-Hashomer
Professor of Medicine, Sackler Faculty of Medicine, Tel Aviv University
Dean, Sackler Faculty of Medicine, Tel Aviv University

Research
Our research concentrates on the impact of coronary calcifications on cardiovascular morbidity and mortality in hypertensive patients. We showed that the presence of coronary calcifications is associated with increased mortality and that diabetic patients without coronary calcifications have a good prognosis. Our team also studied the effect of blood pressure control and stroke outcomes. We showed that elevated systolic blood pressure in acute stroke is associated with poor outcome and that change in BP during the first week after stroke has no effect on outcome. Our main basic research is on metabolic syndrome. How can we improve metabolic syndrome? We also studied the effect of melatonin on the cardiovascular system. Our recent paper in *J Pineal Res* showed that melatonin prevents kidney injury in a high salt diet-induced hypertension model by decreasing oxidative stress.

Atherosclerosis – Research, Treatment and Prevention

Positions
Professor of Medicine, Department of Human Molecular Genetics and Biochemistry, Sackler Faculty of Medicine
Acting Vice President of Research and Development and Academy and Chairman, IRB Committee
President, The Bert W. Strassburger Lipid Center, Sheba Medical Center
Chairman, IRB Committee of the Sheba Medical Center
CEO, Vascular Biogenics Ltd (VBL)

Research
We investigate lipid metabolism, atherosclerosis and vascular biology. In our research, we apply advanced research tools, utilizing in-vitro and in-vivo models and performing clinical trials. In our studies, we focus on basic aspects in atherosclerosis progression and developing new treatments for prevention of the disease.

The current research projects are:
The effect of carotenoids and their cleavage products on the activation of the nuclear receptor RXR and atherosclerosis in mouse models.
The effect of carotenoids on Retinitis Pigmentosa.
The role of the coagulation Factor XI in early and advanced atherosclerosis by using apolipoproteinE/FactorXI double knock-out mice.
The role of apoA5 in atherosclerosis development by using apolipoproteinE/apoAVI transgenic mice.

2015-2017 Pfizer, Phase 3, multi-center, double blind, randomized, placebo-controlled, parallel group evaluation of the efficacy, safety and tolerability of Bococizumab (PF 04950615), in reducing the occurrence of major cardiovascular events in high risk subjects-SPIRE-1
Elucidating the Molecular & Pathophysiological Mechanisms Leading to the Initiation and Progression of Cardiovascular Diseases

Positions (Prof. Keren)
Head, Cardiology Division, Tel Aviv Sourasky Medical Center
Professor, Department of Cardiology

Research
We study the molecular networks leading to the initiation and progression of acute versus chronic presentation of various cardiac diseases. Currently we mainly focus on studying the following cardiac pathologies: 1. Acute myocardial infarction leading to left ventricular dysfunction; 2. cardiac volume overload - a prominent pathology in valvular diseases and chronic heart failure; 3. the prevalent presentation of cardio-renal syndrome. Utilizing the appropriate in vivo models as well as various molecular and cellular techniques, we have been trying to identify novel therapeutic targets for attenuating disease progression and to improve the clinical presentation of these devastating conditions.

Captures of transmitted electron microscopy demonstrating the organized structure of cardiac mitochondria in sham-operated control rats (A) compared to the swallowed unorganized structure of the mitochondria in the heart tissue of animals with chronic kidney disease (B).
Main ongoing research topics

The potential involvement of the cation channel TRPV2, which is highly abundant on peri-infarct immune cells, in the recovery processes following an acute myocardial infarction.

Elucidating the therapeutic potential of anti-metalloproteinase antibodies as well as reagents holding anti-histone deacetylase activity for the treatment of cardiac volume overload.

Cardiac mitochondria as a promising target for attenuation of cardiac dysfunction and progression to cardiorenal syndrome in patients with chronic kidney disease.

Chairman, Division of Cardiology and Cardiac Catheterizations, Rabin Medical Center  
President, Israeli Society of Cardiology

**Research**

Prof. Kornowski has been involved in multiple technology developments and innovative treatment techniques in cardiology. The research activities include:

- Development of new techniques geared towards catheter valve interventions, examining feasibility, safety and treatment outcomes.
- Innovative imaging techniques of the coronary arteries and physiology.
- Study of the cardiac effects of caloric restriction and neuro-hormonal pathways of weight reduction.
- Translational studies of coronary thrombosis and progenitor endothelial cells.
- Translational cardiovascular research of stem cells and gene therapy.
- Development of new medications during and after cardiac catheterizations.
- Research of novel drug-eluting stents and biodegradable scaffolds implanted within the coronary arteries.
- Development of methods of “hybrid” cardiac interventions combined with minimal invasive cardiac surgery to treat structural and coronary diseases.
- Mentoring and guiding students and young cardiologists in the early stage of their career.

Cardiovascular Regenerative Medicine and Targeting of Inflammation and Fibrosis

**Positions**

Professor of Cardiology, Sackler Faculty of Medicine  
Director, Neufeld Cardiac Research Institute, Tel Aviv University  
Director, Tamman Cardiovascular Research Institute, Sheba Medical Center  
Director, Sheba Center of Regenerative Medicine, Stem Cells and Tissue Engineering

**Research**

Our lab is focused on translational research. Specifically, we study cardiovascular regenerative medicine, stem cells and tissue engineering. In addition, we aim to target cardiovascular inflammation and fibrosis using novel nano-medicine and a theranostic (therapy + diagnosis) approach. We use a combination of gene profiling, new biomaterials, liposomes, tissue engineering, physiological testing, and molecular imaging technologies, to understand heart cell biology in vitro and in vivo. Particularly, we work on the development of novel nano-therapies for cardiovascular disease.

Intracellular Regulation of Cholesterol Homeostasis

Positions
Senior Lecturer, Department of Human Genetics and Biochemistry, Sackler School of Medicine
Laboratory Director, Bert W. Strassburger Lipid Center, Sheba Medical Center

The levels of cholesterol in mammalian cells are tightly regulated by cholesterol itself via multitude of negative feedback mechanisms that coordinate its uptake from plasma lipoproteins and endogenous production in the mevalonate pathway. The major rate-limiting step in the mevalonate pathway is catalyzed by the enzyme HMG-CoA reductase, the target of statins class of cholesterol-lowering drugs.

The intracellular abundance, hence activity, of HMG-CoA reductase is strictly controlled by cholesterol and intermediates of the mevalonate pathway, and the research in our laboratory is aimed to unravel the molecular events and cellular factors that operate in the degradation of HMG-CoA reductase protein.

Our studies have wider implications to our understanding of atherosclerosis and neoplastic processes, and afford new perspectives for devising novel therapeutic modalities to combat these diseases.

Research
• Cholinergic regulation of stress and inflammation.
• Exercise-induced urinary protein secretion as a risk for metabolic syndrome.
• Determination of new set of control limits for the identification of patients at risk.
• The influence of work characteristics (burnout and stress) on physical health.

The Tel Aviv Medical Center Inflammation Survey (TAMCIS) is a long-term, ongoing cardiovascular cohort study evaluating stress and inflammation in 22,000 apparently healthy working adults admitting to our medical center for routine annual medical check-ups. It is designed to evaluate the association between physiological and psychological measures of stress, inflammatory profile and their additive effect on cardiovascular risk.

Our database includes more than 50,000 visits with more than 600 parameters per visit; including medical history and medication, laboratory tests (Metabolic profile, Blood chemistry, blood count and Urine tests), ophthalmologist examination, exercise test and spirometry, psychological comprehensive questionnaire consisting of socio-demographic variables, personal and family medical history, health behaviors, among them dietary and sports habits, objective as well as subjective work conditions and various psychological scales such as depression, fear of terror, burnout, perceived control and social support. Research methods include basic molecular biology as well as sophisticated statistical models. The study team includes multidisciplinary researchers and physicians, from internal medicine, cardiology and neurology departments, biology and the School of Management.

Basic and Translational Research of Liver Diseases

Prof. Ziv Ben-Ari, M.D.
Sheba Medical Center, Tel Hashomer

gbenari@bezeqint.net

Positions
Director, Liver Disease Center

Research
Our lab is part of the Liver Disease Center at the Chaim Sheba Medical Center. We focus our studies on basic and applied liver disease research to better understand and improve the diagnosis and treatment of different liver diseases. We utilize various methods such as molecular biology, biochemistry, genetics, tissue culture and in-vitro and in-vivo models. The proximity between the Liver Disease Center and the lab creates a unique and highly successful dynamic relationship where the unsolved clinical needs are immediately translated into research for achieving better solutions.

The research in our lab is divided into two main projects:

1. Molecular mechanisms in the development of liver fibrosis

Fibrosis is the excess accumulation of extracellular matrix (ECM), resulting from chronic, non-resolving inflammation. Multiple etiologies underlie development of liver fibrosis, such as chronic viral hepatitis B or C, autoimmune and biliary diseases, alcoholic steatohepatitis (ASH) and nonalcoholic steatohepatitis (NASH). Fibrosis progression toward cirrhosis is the major cause of liver-related morbidity and mortality. Patients with cirrhosis are more prone to develop liver failure, portal hypertension or infection and are at higher risk of developing hepatocellular carcinoma (HCC). In the normal liver, hepatic stellate cells (HSCs) constitute quiescent, vitamin A–storing cell. Following activation by specific stimuli released by an injured liver, HSCs undergo “activation” or transdifferentiation, yielding a myofibroblast-like cell. We are currently investigating the interactions between hepatocytes and HSCs in healthy and fibrotic livers in the different chronic liver diseases listed above. Our goal is to advance the research in this field and to establish resolution of liver fibrosis.

2. Microbiome and liver diseases

The human gastrointestinal tract hosts a large number of microbial cells, which exceeds their mammalian counterparts by approximately 3-fold. The genes expressed by these microorganisms constitute the gut microbiome and participate in diverse and essential functions, including digestion, regulation of energy metabolism and modulation of inflammation and immunity. The liver, due to its critical functional relationship with the gastrointestinal (GI) tract, is continually exposed to multiple harmful and beneficial microorganisms derived from the small and large intestines. We study the microbiota signature of patients with different liver diseases (Primary Sclerosing cholangitis (PSC), PSC-IBD, Hepatocellular carcinoma and cirrhosis) and compare

Phenotypic alterations in HSCs after activation/differentiation to myoblast-like cells.
them to healthy control. Moreover, we investigate the correlation between environmental lifestyle and diet patterns, the host microbiome and disease etiologies.

Drug Mechanisms and Immunogenicity in IBD

**Positions**

Director, IBD Service, Gastroenterology Dept. Sheba Medical Center

Associate Professor of Medicine, Sackler Faculty of Medicine

Member, Organization Committee, European Crohn’ & colitis Organization (ECCO)

**Research**

We focus on translational science, aiming to study drug mechanisms in IBD. Specifically, we study mechanisms whereby immune-modulating and biologic drugs exert their cellular effects and/or cause unwanted adverse events, as well as immunogenicity of biologic drugs, i.e. the eliciting of immune hyper-responsiveness in the recipient towards the biologic drug. We are interested also in studying novel herbal compounds for possible synergistic effects with conventional immune-modulators.

Completed projects include:

1. A study to decipher the delay in onset of action of thiopurine related to gradual depletion of antigen-specific memory T-cells

2. Development of novel and one of the first available assays to measure anti-drug antibodies against infliximab, and later adalimumab and currently vedolizumab

3. Identifying the Fab fragment as the immune-dominant fragment of infliximab, responsible for eliciting anti-drug antibodies

4. Study of cross-immunogenicity of infliximab and its bio-similar drug, CT-P13

Ongoing projects include:

1. Studying cellular mechanisms responsible for B-cell lymphoproliferation under immune-modulating drugs

2. Studying the decay in immune-suppression following azathioprine withdrawal

3. Studying herbal Chinese compounds effects on cells propagating inflammation

Host: Microbial Interactions - Translational Research in Gastrointestinal Diseases

Positions
Physician-Scientist, Sheba Medical Center
Adjunct Assistant Professor, Division of Pediatric Gastroenterology, Hepatology, & Nutrition, Cincinnati Children’s Hospital Medical Center, OH, USA.

Research
We aim to investigate the pathogenesis of pediatric gastrointestinal disease, with a specific focus on inflammatory Bowel Disease (IBD) and congenital gastrointestinal manifestations. Our main research uses state-of-the-art sequencing approaches and patients’ samples to detect the widest range of microbial shifts and changes in host genes, present in the actual lining of the gut. These analyses are used to better characterize disease phenotype and pathogenesis with an ultimate goal to use this data in the future to better tailor therapy for a specific patient based on gut gene expression, microbial data and genetics.

Within our IBD research we focus on characterizing the role of non-coding elements (non-coding RNAs and GWAS significant non-coding SNPs) and we try to elucidate if and how these non-coding regions part in the host:microbial interactions.

Another interest of the lab is to elucidate genotype:phenotype associations in patients with congenital gastrointestinal manifestations. Using high throughput genotypic analyses, we aim to explore connections between abnormal gastrointestinal metabolism and development with genetics. We hope that by understanding the genetics underlying those pathologies, we will be able to better understand the phenotype and tailor treatment.

Research
We study the role of enteric bacteria in inflammatory and metabolic related disease conditions in humans and in-vitro. Specifically, we study how bacterial proteases impact the epithelial barrier function and how enteric microbial alterations are related to diseases. Clinically, we study the implication of fecal microbial transplantation in disease conditions.

Publications

Fecal supernatants from pouchitis patients have increased proteolytic activity, disrupt epithelial tight junctions and increase epithelial permeability. Fecal supernatants isolated from pouchitis patients compared to healthy controls and normal pouch (NP) patients caused: (A) disruption of tight junction proteins (ZO-1, occludin) as assessed by Western blot. (B) Decrease ZO-1 immunofluorescence (white arrows) of Caco-2 cells monolayers. Alexa anti mouse 488 was used as the secondary antibody (green). Nuclei were counterstained with DAPI and are shown in blue.

Grants
2012 – present Adalimumab for post operative Crohn’s disease patients. Abbvie LTD.
Studying Biliary Atresia Pathogenesis

The etiology remains unknown and there is no effective treatment. We identified an isoflavonoid toxin, biliatresone, that causes BA outbreaks in Australian livestock and we showed that it causes lumen obstruction of neonatal mouse bile duct (NBD) explants. This is a novel tool for the study of BA and allows us to study the primary event in the disease, providing new potential for identifying therapeutic interventions. We found that biliatresone acts by inducing a rapid and transient decrease in reduced glutathione (GSH) and a decrease in SOX17.
in cholangiocytes and that cholangiocyte injury can be mimicked using DL-buthionine sulfoximine (BSO) to reduce GSH or by knocking down Sox17. NBD cultured ex vivo and treated with either biliatresone or BSO showed disruption of the cholangiocyte monolayer, lumen obstruction, and subepithelial myofibroblast differentiation and fibrosis. Both obstruction and fibrosis could be prevented using GSH-protective agents, and were reversible with biliatresone wash out. In this proposal, we aim to define mechanistically the relationship between biliatresone, decreased GSH and downstream signaling molecules (Hey2, Hes1, RhoU, DAAM1 and other WNT signaling pathway genes) in the disruption of cholangiocytes and bile duct integrity. We will study the relationship between changes in cellular tubulin, loss of apical polarity, epithelial permeability and fibrosis and mechanism of repair of cholangiocyte damage and fibrosis. Understanding potential mechanisms of initial injury in BA may lead to new treatments.

Investigating the Mechanisms of Liver Steatosis, Obesity and Cholestatic Injury

Positions
Principal investigator, Research Center for Digestive Tract and Liver Diseases
Tel Aviv Sourasky Medical Center
Senior Lecturer, Sackler Faculty of Medicine

Research
Our lab is investigating two main diseases, liver steatosis in models of diet-induced obesity and insulin resistance and cholestatic liver injury. Obesity and the metabolic syndrome accompanying it affect a large percentage of Western world population and the obesity epidemic is only expected to increase, therefore it’s of the utmost importance to understand the mechanisms involved.

Cholestatic liver injury can be caused by various factors that impair bile flow and result in accumulation of bile in the liver, such as genetic defects, structural/mechanical obstruction of bile ducts impairing bile flow (e.g., common bile duct stones), toxins, and dysregulated function of the immune system. The two main cholestatic disorders in adult human patients are primary biliary cholangitis and primary sclerosing cholangitis for which liver transplantation is the only treatment as the disease progresses to liver failure. Specifically, we are investigating the roles played by sortilin, a trafficking molecule and a co-receptor, in both obesity and cholestatic liver damage, since we have found that sortilin deficiency has a protective role in diet-induced obesity and in murine models of primary sclerosing cholangitis. We are using both isolated liver cells (hepatocytes, cholangiocytes) as well as the cre-flox model where sortilin is deleted in various liver cells in order to further elucidate the mechanisms and signals regulating the protective roles of sortilin.

Research
Children’s growth is regulated by both genetic and environmental factors. The most effective environmental factor is nutrition; however, the
mechanisms connecting nutrition and longitudinal growth are still not fully understood. Deciphering these mechanisms both in children and in animal models of rats and mice, has been the focus of our research, as currently means to improve growth in short stunted children are very limited.

We have identified several novel and important factors that are involved in regulation of this process, including growth factors that are produced and secreted from adipocytes such as leptin and GDF5, transcription factors such as hypoxia inducible factor (HIF)-1, and epigenetic factors such microRNAs and histone deacetylases including SIRT1, HDAC10. We have also studies extensively the effect of nutritional manipulation on bone quality in young rats. We may now exploit these findings as targets of new treatment strategies for children with growth disorders as well as children with special nutritional needs like premature babies, infants and children with chronic diseases associated with nutritional problems.

Investigating Lipid Metabolism and Atherosclerosis

**Positions**
Senior Lecturer, Medicine, Sackler School of Medicine

**Research**
Our research interests are within the fields of metabolic inflammation that contributes to the derangements of fat accumulation in atherosclerosis, fatty liver disease and diabetes. Specifically, we study the role of the inflammatory cytokine IL-1α and the ubiquitin-like protein HLA-F Adjacent Transcript 10 (FAT10) in these diseases. We recently discovered that the inflammatory cytokine IL-1α has an important role in early and advanced stages of atherosclerosis and fatty liver disease. We also discovered an unexpected role of IL-1α in determining ovarian lifespan and fertility.

We apply advanced technologies including genetically modified mice (Cre/loxP), molecular and cellular biology and microarray analysis to identify and functionally characterize genes that regulate atherosclerosis with the ultimate aim to prevent and treat this deadly disease.

**Publications**

Investigating the Impact of Maternal Fatty Acids Quality on the Fetal Gene Programming and Fingerprint of Health or Obesity Associated Disease

Positions
Associate Professor, CAMEA, Sackler Faculty of Medicine
Researcher at the Bert Strassburger Lipid Center, Sheba, Tel Hashomer

Research
We study the effect of maternal dietary fatty acids quality during pregnancy and lactation on the gene networks that are involved in lipogenesis and thermogenesis in the offspring. Obesity-associated chronic metabolic diseases such as Cardiovascular, Type 2 diabetes and Non-Alcoholic Steatohepatosis are purported to have an early in utero origin. The nutrigenetic impact of fatty acids quality in normcaloric diets and healthy mothers during development is almost unknown. We are exploring this question by studying the metabolic and genetic evolution of the offspring from birth to adult age in our animal nutritional model and in humans. We apply the latest methodologies including biochemistry, lipidomics, molecular biology, and microarray analysis to identify and functionally characterize genes that regulate the lipogenic and thermogenic processes that determine the energetic balance leading to obesity or its absence. Understanding the normal or obesity prone gene programming during development and characterizing the associated fingerprint in the offspring at birth is essential for the early diagnosis and design of treatments to prevent long-term metabolic obesity-associated disorders that are leading causes of disease in almost 40% of world population and death.

Protein interaction between products of genes upregulated (red full) or down-regulated (blue full) by ω3 essential fatty acid (ALA) or saturated fatty acids (SFA). Enriched functions are marked using open colored circles.

Review

Mechanisms for the Development of Obesity and Diabetes – Molecular and Translational Aspects

Position
Associate Professor of Medicine, Sackler Faculty of Medicine

Research
With the worldwide epidemic proportions of obesity, its related morbidities such as cardiovascular disease and diabetes have become an emerging threat for public health. While the strong genetic predisposition for these conditions is a subject of intense research, less is known about the strong influence of various environmental factors on the pathophysiology of obesity and diabetes. We have recently established the Endocrinology and Diabetes Research Center at the Institute of Endocrinology at Sheba Medical Center with the vision to promote all aspects of research in the field of obesity, insulin resistance and diabetes.

Our group has focused on the following aspects of the pathophysiology of obesity and diabetes:

a. The role of food preservatives as ‘metabolic disruptors’: Some environmental and nutritional factors have been demonstrated to act as ‘endocrine disruptors’, with the ability to act as agonists or antagonists to certain receptors in a wide variety of biological systems. We have identified a common food preservative, with distinct metabolic effects. We were able to demonstrate that this food preservative results in an increase in hepatic glucose production as well as in changes in glucagon and insulin levels leading to liver insulin resistance. Chronic exposure results in weight gain, increase adiposity and systemic insulin resistance in mouse models. We are currently working on translating our preclinical results to humans in a series of randomized controlled trial. In addition, we continue to work using in-vitro and in-vivo animal models to assess the effects of micronutrients in modern nutrition on the development of obesity and diabetes.

b. Cellular mechanism linking over-nutrition with inflammation, insulin resistance and diabetes: Previous studies have clearly demonstrated that chronic inflammation and cellular stress is a central feature of obesity and its associated metabolic disease cluster. This inflammatory response is distinct, appears to respond to intrinsic cues, and does not resemble the classical inflammatory paradigm. Significant data have emerged in recent years on the molecular mechanisms leading to the development of these inflammatory and stress responses and how they are linked to metabolic homeostasis. Our research is focused on the regulation and adaptation to inflammation and stress within the tissue milieu in metabolically relevant tissues such as liver and adipose tissue. More specifically, we study cell-cell communication and the propagation of inflammatory and stress signals between cells within a tissue and the potential role of such communication in mediating insulin resistance and metabolic abnormalities.

c. In addition to utilizing basic research tools to promote our understanding on the mechanisms leading to insulin resistance and diabetes, we involve in clinical studies assessing novel risk factors and potential therapeutic approaches for these conditions. We are currently involved in several studies looking at the potential role of the novel adipokine FABP4 (fatty acid binding protein 4) in the insulin counter-regulatory response to hypoglycemia and as a potential contributor to the pathophysiology of gestational diabetes.

Deciphering the Molecular Basis of Inborn Errors of Metabolism and Rare Genetic Disorders

**Positions**
Professor, Sackler Faculty of Medicine
Director, Metabolic Disease Unit, Edmond and Lily Safra Children’s Hospital, Sheba Medical Center, Tel-Hashomer
Chairman, Israeli Society for Metabolic Diseases (ISMD)

**Research**
At the Metabolic Disease Unit and the Molecular Biochemistry laboratory at the Sheba Medical Center, we strive to identify and characterize the molecular basis of an array of inborn errors of metabolism (IEM) and other rare inherited disorders. As a referral center for patients with a wide array of IEMs, we take a “bedside to bench to bedside” approach, studying the biochemical pathways and genetic basis of their disease, delineating the functional effects of the disease-causing variants, and aiming our efforts at the exciting possibilities for novel therapeutic approaches.

In the past few years, we were the first to identify a causative association between variants in several genes and a number of new neurometabolic disorders, as published in the *New England Journal of Medicine*, *American Journal of Human Genetics*, *Brain*, *Journal of Biological Chemistry*, among others. This was the case, for instance, of an autosomal recessive subtype of Polyarteritis Nodosa vasculopathy, caused by

### Clinical Features of Polyarteritis Nodosa Associated with Adenosine Deaminase 2 (ADA2) Mutations
Clinical manifestations of polyarteritis nodosa included digital necrosis of the toes in Patient B-III-3 (Panel A) and Raynaud’s phenomenon and livedo reticularis in Patient B-III-6 (Panel B). Angiography of the celiac artery in Patient B-III-3 revealed an aneurysm (Panel C, arrow). Periarteritis, fibrinoid necrosis of the media, and destruction of the elastic laminae were revealed in a biopsy specimen of the superior mesenteric artery in Patient A-III-1 (Panel D, hematoxylin and eosin).
variants in the CECR1 gene, encoding Adenosine Deaminase 2 (ADA2). Since the publication of our results [Navon Elkan P et al. N Engl J Med 2014], this disorder, manifesting with early-onset cerebral infarctions (among others), has been diagnosed in numerous families worldwide.

Most recently, we identified and characterized a newly recognized inherited neurotransmitter deficiency, caused by mutations in DNAJC12 [soon to be published in the American Journal of Human Genetics]. This disorder was found to manifest in hyperphenylalaninemia, dystonia and intellectual disability. Interestingly, patients with the DNAJC12-associated phenotype showed dramatic clinical improvement following early treatment with BH4 and/or neurotransmitter precursors, and thus this unique disorder is a new treatable and preventable cause of intellectual disability.

Research
Our main interest lies in the deciphering of novel genetic and epigenetic mechanisms affecting global gene expression and their implication in cancer and neuronal disorders.

Our research interests are:
• The deciphering of the role of RNA epigenetics, including RNA editing and RNA methylation in the regulation of gene expression and cell fate.
• The study of transposable genetic elements in cancer and development
• Genetic and genomic studies relevant to cancer and genetic diseases
• Genetically non-identical tumors

Rare Diseases Diagnosis and Research

Positions
Pediatrician - Medical Geneticist, Sheba Medical Center
Director, Institute for Rare Diseases
Associate Professor, Sackler Faculty of Medicine
National Coordinator, Orphanet Israel
National Coordinator, Rare Diseases National Registry

Research
There are more than 6000 rare diseases affecting more than 60 million people in Europe and the US alone. Most of these diseases are affecting children, are chronic and are of genetic etiology.

Advances in rare disease research are very quickly changing the pediatric care for children affected with these non-identified diseases which are very often complex. Research is one of the basics stones for building an accurate care of patients and families. Here, we wish to incorporate research to awareness, diagnosis, treatment and health policy. Our goals include identification of rare diseases causing genes, study the function of the abnormal protein, and finally deciphering new protein pathways in order to establish new therapies. Since the laboratory is in a clinical setting the results of the work is translated into genetic counseling and clinical care and sometimes treatment (MPS II-MPS IV-Fabry disease). With this in mind we are performing cellular studies and drug screens targeted to rare diseases in collaboration with other laboratories, aiming to better understand pathways such as the one linked to mucolipin 1 involved in the mucolipidosis IV clinical symptoms with the goal to provide a specific therapy.

In the field of clinical research, we focus on different subjects that include different topics such as: Natural history of MPS III (Hetz project; Understanding of the practical aspects of the medical genetics (Genet Med. 2016;18(4):372-7); Ongoing project on how the patients are dealing with the information linked to the results of the use of new technologies such as CNV and Exome sequencing.
The text contains multiple names and references to different studies on various genetic conditions. It seems to be a collection of findings related to genetic diseases and their characterization. The text includes names of researchers, titles of their publications, and details about their findings related to these genetic conditions.

For example, one reference mentions the characterization of Greater Middle Eastern genetic variation for enhanced disease gene discovery. Another reference discusses microcephaly and developmental delay caused by biallelic variants in TBCD. There are also references to studies on tubulinopathy and other genetic disorders, along with the names of the researchers involved in these studies.

The text appears to be a comprehensive summary or review of research findings related to genetic diseases and their genetic underpinnings. It highlights the complexity and diversity of genetic conditions and the ongoing efforts to understand and classify them.

Reviews

New Gene Identification and Genotype-Phenotype Correlation

Positions
Associate Professor of Pediatrics and Human Molecular Genetics and Biochemistry, Sackler School of Medicine
Committee Member, Israel Medical Association, Israeli Board of Medical Genetics, American Society of Human Genetics, American Board of Medical Genetics, Institutional Review Board (Helsinki) Assaf Harofeh
Member, Research and Development Committee, Tel Aviv University

Research
We study genetically undefined families using homozygosity mapping and EXOME analyses, in collaboration with other leading centers, to define disease causing genes. Once a causative mutation is defined, further functional studies are carried out. We identified at least five new genes in the last decade that enabled counseling patients and prenatal diagnosis.

We investigate the genotype-phenotype correlation of newly defined mutations to expand the disease spectrum and impact of genetic disorders.

Investigating the Molecular Genetics of Skin Diseases

Positions
Chair, Department of Dermatology, Tel Aviv Medical Center
Professor, Sackler Faculty of Medicine, Tel Aviv university

Research
Our laboratory has been investigating the genetic basis of skin disorders for the past 15 years. Monogenic skin disorders are known to be prevalent among Middle Eastern populations, and at this regard, our laboratory is ideally situated to carry research in that field. These efforts have led to the deciphering of the molecular basis of more than 20 genetic diseases by members of our group. The deciphering of the molecular basis of a monogenic disorder invariably reveals a novel pathway whose importance is exemplified by the disease resulting from its malfunction. We systematically explore the mechanistic aspects of these new pathways using almost exclusively humanized models such as three-dimensional skin equivalents, hair organ cultures and chimeric mouse models. Once the function of a novel gene product is established, this new knowledge can be translated in the form of new treatments for rare and more common diseases alike. For example, we have found that defective expression of P-cadherin causes hair loss due to disrupted Wnt signaling. We are now developing small inhibitors for this new pathway as a new treatment for conditions associated with excessive hair growth. Based on a similar paradigm we are now also investigating the genetic basis of complex skin traits including psoriasis and pemphigus, a dreadful autoimmune disorder associated with 90% mortality if left untreated.

The Lab for microRNA Research

**microRNAs in human disorders: Psoriasis**
One of the main research subjects in the lab is the involvement of miRNAs in psoriasis. We found that the miRNAs’ expression differs between psoriatic and normal skin. Some of these miRNAs are involved in biochemical cycles which regulate skin development and others regulate the interplay between immunocytes and keratinocytes. We are exploring how the expression of these miRNAs is regulated and how they affect the pathogenesis of the disease.

**Skin cancer squamous cell carcinoma (SCC)**
Skin carcinogenesis, as in most other cancer types, is believed to be a multi-step process with several steps along its malignant evolution: Solar elastosis (SE), actinic keratosis (AK or KIN1-2), a more advanced stage of AK; (KIN3) and CSCC. Using high-throughput deep sequence analysis of five stages along the malignant evolution we clearly see that miRNAs expression is distinct in each of the predefined five stages of malignant progression, a typical signature characterizes each stage. Currently we are investigating the biochemical pathways regulated by these miRNAs and their role in the malignant transformation of keratinocytes.
Parasites exosomal miRNAs as diagnostic tool and their effect on host immune cells

Parasitic infections are responsible for considerable human suffering. Currently, diagnosis and management of parasitic infections is challenging in many settings. We hypothesize that pathogen-specific miRNA can be utilized to understand, diagnose and manage parasitic infections. We have undertaken a pilot study of schistosomiasis as preliminary proof-of-concept for need and feasibility of miRNA-based diagnosis for parasitic infections. Schistosomiasis is a parasitic disease caused by helminthes (blood-flukes) of the genus Schistosoma that affects more than 200 million people, mostly in the developing world. Infection in returning travelers has received increasing attention, including among Israeli travelers. We were able to detect the presence of schistosomal miRNAs in the micro-vesicles fraction harvested from the patient sera. The Schistosoma parasites have developed multiple mechanisms for modulating or suppressing host immunity. We hypothesize that the adult Schistosoma utilizes secreted exosomes as a mechanism to manipulate and escape the immune system. Currently, we have data suggesting this hypothesis.

Molecular and Cellular Studies of Rare Disorders of Hematopoiesis

Positions
Professor of Pediatrics, Sackler Faculty of Medicine
Director, Hematology Unit, Schneider Children’s Medical Center of Israel

Research
We study rare hematological disorders, using different cellular model systems. The roles of codanin-1 in normal hematopoiesis and in the pathogenesis of congenital dyserythropoietic anemia type I (CDA I). CDA I is a rare disorder causing anemia and bone abnormalities. We have identified CDAN1, the gene causing CDA I, in 2002, by linkage analysis. Codanin-1, encoded by CDAN1, is ubiquitously expressed and necessary for early embryonic development. However, its roles in hematopoiesis are not known. We generated erythroid tissue specific KO mice, and identified early anemia and embryonic lethality caused by a complete lack of codanin-1. We are also utilizing other model systems for the disease, including K562 cell line, murine fetal liver erythroid differentiation system, and primary human erythroid cultures. Understanding the roles of codanin-1 in red blood cells development may shed light on specialized processes involved in erythropoiesis. Even more significant, elucidating the role of codanin-1 in CDA I may help develop novel therapeutic approaches to alleviate the anemia in these patients.

The pathomechanisms of severe congenital neutropenia and cyclic neutropenia through patients will be understanded by using derived induced pluripotent stem cells. We use the cutting edge technology of induced pluripotent stem cells generated from patients with congenital neutropenia as a model system for severe congenital neutropenia and cyclic neutropenia, caused by ELANE mutations. We aim to define the granulopoietic defects caused by these mutations, establish a genotype-phenotype correlation of iPSC lines carrying ELANE mutations causing both diseases, and study novel potential therapies by pharmacological correction of the granulopoietic defects detected.

Primary Immunodeficiencies (PIDs) – From Bed to Bench and Back

Positions
Head, Pediatric Department, Immunology Services

Research
Our research focuses on:
1. Primary immunodeficiencies - finding and characterizing novel diseases
2. Newborn screening for immunodeficiency
3. Investigating fetal immunity in health and diseases
4. Next generation sequencing to illustrate and understand for T and B cell receptor repertoires

Our pediatric immunology clinic and laboratory are dedicated to the diagnostic evaluation, treatment, monitoring and research of patients with disorders of the immune system, including congenital immunodeficiencies and autoimmune diseases. In addition, we are leading Israel in the field of newborn screening for severe immunodeficiency and recently became the national laboratory for validating results obtained from this program. We are acknowledged as a “Jeffrey Modell Diagnostic and Research Center for Primary Immunodeficiency” (www.jmfworld.org) – which is the “gold standard” benchmark for excellence in this field. Part of our service is in-house laboratory which is well-experienced in the most advanced immunological and molecular assays that are used world-wide to assess immune function. We are interested in thymus functions in health (embryonic development and neonates) and in PIDs, as reflected by V(D)J rearrangement and thymic output of T cells, as well as B cell development, using advanced molecular methods, such as TREC and KREC analyses and next generation sequencing (NGS). We use whole exome sequencing (WES) to discover new PIDs. This approach led us to identify to date several novel mutations that cause inherited PIDs. We found that mutations in two of these mutated novel genes, VPS45 (New England Journal of Medicine, 2013) and STN1 (Journal of Experimental Medicine, 2016) cause syndromic PIDs, i.e. severe congenital neutropenia (SCN5) and Coats plus, respectively. In our large PID cohort of patients some mutations were found in genes that have not been known until now to be involved in the development of the immune system. We continue to find such mutations in novel genes that cause PIDs...
with atypical clinical characteristics and study their pathophysiology mechanisms, using also a zebra fish model. Characterization of proteins encoded by the activity of these genes in immune cells of patients compared with those of healthy individuals enable us a better understanding of the development and function of the immune system, as well as designing new targeted drugs or gene therapy to the immune deficiency the patients suffer from. Another interest in our lab is to investigate T and B cell development and repertoire productions in health and disease including the development of the immune system in fetal life (Science Translational Medicine, 2015). We have used traditional methodologies (e.g. flow cytometry or PCR analysis) to illustrate cell repertoire in patients with immunodeficiency, autoimmunity and in developing human embryos. Yet the recent development of next generation sequencing (NGS) techniques enabled analysis of these immune repertoires to a depth that was unreached before. This was already used by us in various pathologic conditions including immunodeficiencies, autoimmune disorders and infections. One of the advantages of the NGS technology over the traditional methodologies for investigation of the expanded clones and for clinical follow-up is that it ensures finding of the clonal receptor rearrangements in every patient due to the enormous depth of sequencing. It allows for the detection of multiple sub-clones, specific preferential usage of V, D and J gene segments and complementarity determining region 3 (CDR3) characteristics and to look for clonotypic sharing in patients with a similar disease. In addition, with the use of the CRISPR-Cas9 genome editing platform, we are modeling relevant primary immunodeficiency causing genes, such as RAG1/2, DCLRE1C (artemis) and ATM in wild type human lymphocyte cell-lines, and are using this ‘bed to bench and back’ approach to correct these mutated genes as a strategy to develop innovative curative gene correction therapy in patients’ cells.

Investigating Infectious Diseases

Positions
Head of Department, Medicine E, Rabin Medical Center, Beilinson Hospital
Sackler Faculty of Medicine
Editor-in-Chief, Clinical Microbiology and Infection
Director, Infectious Diseases University Research Center, Rabin Medical Center, Beilinson Hospital

Research
Our research focuses on improving the treatment and management of patients with severe infections and at the same time, focusing on interventions that will reduce the rise of resistance to antibiotics in microorganisms. Our main goal is to reduce mortality and suffering caused to patients by these infections.

Together with partners in Denmark, we have developed a computerized decision support system for antibiotic treatment in patients with moderate to severe infections. It was tested in a multi-center trial in three countries, and was shown to improve the outcome of patients, while at the same time reducing unnecessary use of antibiotics and hospital stay.

Our studies, systematic reviews and meta-analyses and clinical studies, served to change international guidelines and improve patient’s management. For example:

- Study that stopped the use of single-dose antibiotics for urinary tract infection.
- A clear evidence on the benefit of appropriate empirical antibiotic treatment
- Antibiotic prophylaxis for neutropenic patients.
- Discontinuing the use of beta-lactam/aminoglycoside combinations.
- Proof that some antibiotics (tigecycline and cefipime) are less effective than others.
- Current projects

- Optimizing diagnosis, treatment and outcome definitions in elderly patients with bacterial infections (Ministry of Science, Technology and Space).
- The impact of a decision support system for antibiotic decisions on appropriateness of treatment, morbidity and mortality, consumption of antibiotics and resistance to antibiotic drugs (The Israeli national institute for health policy research).
- Combatting Bacterial Resistance in Europe – Molecules against Gram Negative Infections (IMI – COMBACTE-MAGNET).

Investigating Cognitive and Emotional Difficulties that Typify Different Psychopathologies in Life Span: Therapeutic Brain Stimulation

Positions
Senior Lecturer, Sackler Faculty of Medicine
Co-Cordinator, Course of Continuing Medical Education in Psychiatry, TAU
Head, Child and Adolescent Outpatient Clinic “Shalvata”

Research
Our research work is embedded in our clinical dilemmas and difficulties. Our studies have focused on: Cognitive and emotional domains in the course and development of different pathologies, especially depression and ADHD. We are interested in the interplay between anxiety and ADHD and a differential effect of Methylphenidate on state anxiety. We were able to show effects of depression on cognition in depressed adolescents with some cognitive domains related to the depressive episode and others to the trait. In recent years, our studies have focused on brain stimulation, especially deep transcranial magnetic stimulation (rTMS), effects of pharmacological and psychotherapy and placebo on emotions and cognition.

Incumbent, Sieratzki Chair in Neurology, Sackler School of Medicine
Sagol School of Neuroscience

Research
We have been leading a large-scale research endeavor to clinically and epidemiologically characterize the Ashkenazi Jewish Parkinson's Disease (PD) population in Israel and to identify genes that influence the risk of developing the disease in this population. In recent years our group has conducted groundbreaking research on the influence of mutations in two major genes - LRRK2 and GBA. The research was first aimed at identifying the prevalence of mutations in these genes in patients with PD and explores differences in phenotype. Our research then evolved to include first degree relatives of these patients to explore early markers of disease in healthy asymptomatic carriers. In addition to examining the contribution of risk mutations, the existence of protective haplotypes or genes was also investigated. For example, recent work has shown that immune system B cells may contribute to protection from the disease or influence its progression. The above described research has opened new avenues of exploring disease identification, progression and even prediction and could potentially impact treatments in PD.

In recent years, we have also been involved in exploring new interventions for the patients with PD. These include exploring the effects of tDCS stimulation and virtual reality to improve motor-cognitive function and functional abilities of patients with PD. This work builds on the study of movement disorders, on the one hand, and on examining ways to ameliorate motor symptoms in patients with PD.

Investigating the Vestibular and Ocular Motor Systems

Positions
Professor, Department of Neurology, Sackler Faculty of Medicine.

Director, Dizziness and Balance Disorders Service, Department of Neurology, Meir Medical Center

Head, Machado-Joseph Disease (MJD) Clinic (recognized by the Israel Ministry of Health)

Research
The vestibular system stabilizes gaze during head movements, ensuring clear vision of the seen world. This is mainly accomplished by the vestibulo-ocular reflex (VOR), which produces compensatory (opposite) eye movements for head rotations. Then, eye position in space is held steady and images do not slip on the retina. During everyday life activities, the vestibular system acts with the optokinetic and visual fixation systems to hold images of the seen world steady on the retina; while saccades, smooth pursuit and vergence eye movements obtain and hold images of objects of interest on the fovea. Moreover, in everyday life activities, the vestibular, visual, ocular motor, proprioceptive and motor systems work together to reach exquisite balance, equilibrium and perform accurate motor tasks. Interaction between sensory (vestibular, visual, proprioceptive) and motor (eye movement, locomotion) systems; i.e sensory-motor integration is essential to maintain balance, equilibrium and perform accurate motor tasks including locomotion. Our Vestibular and Eye Movement Laboratory is fully equipped with modern systems for measuring vestibular function, all type of eye movements and balance and gait function.

Our three major ongoing interest and research projects include:

1. Vestibulo-Ocular Reflex (VOR) and eye movement abnormalities as possible biomarkers of Spinocerebellar Ataxia Type 3.

Spinocerebellar Ataxia Type 3 (SCA-3), also known as Machado-Joseph Disease (MJD), is an autosomal dominant neurodegenerative disorder for which genetic testing can reveal those at risk for developing the disease. Quantitative measures that would identify pre-symptomatic gene carriers at the threshold of clinical diagnosis would be extremely valuable in early diagnosis, tracking disease progression, and assessing treatment. This is a crucial subject of investigation not only in SCA-3 but also in other neurodegenerative diseases. Eye movement abnormalities have been reported as reliable neurophysiologic biomarker and even proposed as “a window into disease prevention.” By using bedside vestibular tests and laboratory recording of eye movements, we have described severe VOR deficit and different saccadic abnormalities in patients with SCA-3. Our specific aim is to investigate if VOR and eye movements can be used as biomarkers to quantify the appearance and progress of SCA-3 even pre-symptomatically.

2. Dizziness, vertigo, balance: Clinical and basic research
Dizziness, vertigo and problems with balance are among the most frequent complaints at all ages. Our current research focuses on the following topics:

The contribution of VOR impairment to the perceptual and emotional experience of blurred vision, dizziness and oscillopsia (in collaboration with the School of Psychological Sciences, Psychobiology Research Unit, Tel Aviv University).

The relationship between vestibular pathology and the development of anxiety, balance impairment and spatial disorientation (in collaboration with the School of Psychological Sciences, Psychobiology Research Unit, Tel Aviv University).

The evaluation of a novel specs device with stabilizing marks on the peripheral visual field to alleviate dizziness.

The search for novel physical and virtual reality strategies to improve balance and alleviate dizziness.
3. Cerebellar Disorders

As our Neurology Department at the Meir Medical Center houses the only Machado-Joseph Clinic in Israel recognized by the Ministry of Health, we therefore have access to most MJD sufferers and many other cerebellar patients in the country and focusing on the following research topics:

- Respiratory function in cerebellar degeneration.
- Autonomic nervous system function and emotional features in cerebellar diseases.
- Cognitive and behavioral changes in cerebellar degeneration.
- Physical and pharmacological treatment of cerebellar disorders.
- Language and reading difficulties in cerebellar diseases (in collaboration with the School of Education, Tel Aviv University).
- The role of the cerebellum in the hedonic experience of music (in collaboration with the Functional Brain Center, Wohl Institute for Advanced Imaging, Tel Aviv Sourasky Medical Center).
- The mutational origins of Machado-Joseph Disease in the Jew Yemenite subpopulation in Israel (in collaboration with the IBMC - Institute of Molecular and Cell Biology, and IPATIMUP – Institute of Pathology and Molecular Immunology of University of Porto, Portugal).

Neurogenetics Syndromes

Positions
Professor, Psychiatry & Sagol School of Neuroscience
President, Israel Society of Biological Psychiatry
Director, The Behavioral Neurogenetics Center
Director, The Child Psychiatry Division, Sheba Medical Center

Research
We have been studying neurogenetics syndromes - 22q11.2 deletion syndrome (22q11.2DS) and Williams syndrome for two decades. 22q11.2DS is the most common known microdeletion syndrome. The 22q11.2DS phenotype consists of cleft and cardiovascular anomalies and immunological abnormalities. Additionally, all individuals with 22q11.2DS cope with cognitive deficits and one-third of the patients develop schizophrenia-like psychotic disorders and many manifest with autism spectrum disorder. We study the pathways leading to psychosis, autism and cognitive deficits in 22q11.2DS. Our focus is identifying cognitive, behavioral and psychiatric risk factors associated with the evolution of psychosis in 22q11.2DS. We also study molecular and immunological pathways to psychosis and to the behavioral and cognitive phenotype of the syndrome using blood samples and animal models. We collaborate with many centers from US and Europe under the umbrella of the International Brain and Behavior Consortium funded by the NIMH.

Investigating the Association between Drug Use and Psychiatric Disorders

**Positions**
Senior Lecturer, Sackler Faculty of Medicine
Physician-in-Chief, Lev Hasharon Medical Center

**Research**
We study the association between drug use and psychiatric disorders. We harness epidemiological and clinical approaches aimed at improving the understanding of mental health related aspects of drug use.

Specifically, much of our current research focuses on psychiatric outcomes of cannabis use. In recent decades, there has been a significant increase in the prevalence of cannabis use, as well as in the potency of cannabis consumed. This holds several medical and social implications, some of which are yet unclear. We focus on exploring mental-health related outcomes of cannabis use by conducting epidemiological research using large population-based samples and analysis of “big-data” based on internet-based sources. In addition, we explore specific neuro-biological and neurocognitive aspects of heavy cannabis use by utilizing advanced functional technologies such as Transcranial Magnetic Stimulation (TMS). Our studies regarding the effects of cannabis on depression and anxiety are commonly cited in World Health Organization publications, and our reports on mental-health related aspects of medical marijuana and prescription opioids have served as a base for national policy papers.

Head, Functional Neuroimaging Laboratory, Department of Diagnostic Imaging, Sheba Medical Center, affiliated to Sackler Faculty of Medicine

Researcher, Sagol Neuroscience Center, Sheba Medical Center.

Research

The Functional Neuroimaging Lab Studies brain pathologies, in particular the way the brain reorganizes due to brain injury (TBI). We use various tools including: advanced structural MRI and fMRI protocols using tailor-made fMRI tasks to examine the deficits after TBI. We apply also extensive neuropsychological batteries in order to investigate cognitive impairments. Furthermore, we examine symptoms and emotional status using validated questionnaires and scales. This data is integrated and analyzed to identify networks and patterns which will further our understanding of neuropathology and neuronal reorganization. Our research aims to improve the prediction of brain pathology’s progression, to plan medical and rehabilitative interventions for the well-being of patients with brain diseases and head injuries.

Publications

The relation between severity of TBI and working-memory brain activation during an n-back task. Maximum intensity projections in three orthogonal views of the brain (from left to right: sagittal, coronal and axial) depict areas of significant activation (p<0.005, k>100) in a one-tailed t statistic contrasting MR signal increases. The color scale shows t-values to the right. a, c: 2->0-back= high WM load; b, d: 2->1-back= WM load increase; CTRL= controls; mTBI= mild TBI; msTBI= moderate-severe TBI. mTBI patients further activated bilateral prefrontal and left parietal regions. msTBI patients revealed greater activation than controls in frontal, parietal and limbic regions.

The Role of Neuroinflammation and Neurocoagulation in the Pathophysiology of Neurological Disorders

Positions
Senior Lecturer, Sackler Faculty of Medicine
Senior Neurologist and Neurophysiologist, Department of Neurology, Chaim Sheba Medical Center, Tel HaShomer

Research
Our research focuses on the understanding of the role of coagulation factors, as well as their interaction with neuroinflammation in the physiology and pathophysiology of the nervous system. We have recently discovered that thrombin, the factor that ignites the coagulation cascade, is synthesized in the brain and has a fundamental role in regulating synaptic plasticity. However, we have also shown that high concentrations of thrombin (that reach the brain upon haemorrhage) can cause seizures and epilepsy. Our research has contributed in designing novel compounds that are currently being tested in order to counteract the pathogenic actions of thrombin in the brain. We apply cutting-edge technologies including mouse genetic tools, behavioural analysis, electrophysiology and molecular and cellular biology.

Publications

The coagulation pathways play fundamental roles in the physiology and pathophysiology of the nervous system. Immunofluorescence analysis reveals the expression pattern of thrombin in the hippocampus.

The Neuronal Encoding of Human Speech

Positions
Senior Lecturer, Sackler Faculty of Medicine and Sagol School of Neuroscience
Senior Researcher and Neurophysiologist, Functional Neurosurgery Unit, Tel Aviv Sourasky Medical Center (“Ichilov”)

Research
We study the neuronal representation of speech production, perception and imagery in the human brain. We explore the acoustic, phonetic and phonological levels, and the deterioration in speech due to neurological disorders, for example in Parkinson’s disease. Our main focus is the encoding of speech features by single neurons (for example, see Figure 1). We also aim to develop brain-machine interfaces for restoring speech faculties in completely paralyzed persons by decoding their neuronal activity (i.e., inferring speech contents solely from spiking activity).

We take advantage of a unique clinical “opportunity” to work with neurosurgical patients undergoing implantation of electrodes for clinical reasons. Experiments are conducted intra-operatively with awake patients with movement disorders or in the ward, with epilepsy patients. Understanding the neuronal representation of human speech is essential for understanding the underlying mechanisms of speech disorders, for the development of new...
therapeutic procedures, and for restoration of the ability to speak. The research thus bears enormous potential to greatly improve the quality of life of millions of people around the globe.

Investigating Age-Related Macular Edema and Diabetic Retinopathy

**Positions**
- Professor of Ophthalmology, Sackler Faculty of Medicine
- Assistant Dean, Sackler Faculty of Medicine
- Head, Department of Ophthalmology
- Incumbent, Sydney A. Fox Chair in Ophthalmology
- Editorial board member: *Retina, European Journal of Ophthalmology, Ophthalmologica, Graefes for Archives and Research in Ophthalmology*
- Associate editor, *International Journal of Retina and Vitreous*
- Editor in Chief, *Case Reports in Ophthalmology*
- Chairperson, National Ethics Review Board Committee, State of Israel Ministry of Health
- Board member, Israeli Council of Surgery and Anesthesia
- Chair, Academia Ophthalmologica Internationalis
- General Secretary of the Board, Euretina Society
- International Committee Member, Macula Society

**Research**
Prof. Loewenstein's main research area is early detection of macular degeneration, including development of novel technology, which is approved and used now in the USA, as well as development of automated techniques for interpretation of ophthalmic imaging. She has vast interest in toxicity to the retina of drugs. In addition, she is developing devices for slow release devices for drug administration in the retina. One of the latest toxicity studies was that of the toxicity of ziv aflibercept, a drug that can be potentially used for the treatment of asacular retinal disease was evaluated and shown to have local toxicity. This is one example of a toxicity study with significant clinical correlation.

**Publications**

Retinal imaging (Optical coherence tomography- OCT and Fluorescein angiography- FA) of a very early neovascular macular degeneration lesion detected by the preferential hyperacuity perimetry technology developed for early detection of macular degeneration.

Neurodegeneration in the Eye

Immunofluorescence analysis (A), histopathology analysis (B) and MRI (C) for monitoring stem cell therapeutic effects in animal models. Multicolor OCT imaging (D) and chromatic multifocal pupilloperimetry (E) for objective structure & function clinical assessment. Nanotherapy for stem cell modulation (F).
Research

We lead basic science, translational medicine and clinical studies in an attempt to solve the unmet needs in neurodegenerative diseases in the eye and brain. The research focuses on clinical trials, basic science and translational medicine aimed at development of novel treatments and diagnostic tools for retinal degeneration and brain pathologies (such as Alzheimer disease and increased intracranial pressure) using a multidisciplinary approach in an attempt to discover treatments and develop drug delivery and diagnostic platforms for studying these leading incurable diseases.

Current research projects include:

- Development of novel treatments for neuroretinal degeneration
- Development of innovative diagnostic tools for macular, retinal degeneration and optic nerve diseases
- The eye as a window to the brain – using retinal structure and function measurements as novel early and objective biomarkers for brain neurodegeneration diseases (e.g. Alzheimer’s disease and multiple sclerosis), brain injuries and brain tumors.

Public Health
Positions
Head, Epidemiology & Database Analysis Department, Maccabi Institute for Research & Innovation, Maccabi Healthcare Services
Associate Professor, Epidemiology & Preventive Medicine Division, School of Public Health, Tel Aviv University
Adjunct Investigator, Radiation Epidemiology Branch, Division of Epidemiology and Genetics, National Institute of Cancer, National Institutes of Health, Bethesda (MD), USA
Head, Academic Department of Public Health, Medical Division. Maccabi Healthcare Services

Research
Our primary research interests focuses on the use of Maccabi's large database to examine multiple dimensions of health care quality, including safety (e.g. adverse effects of IVF, renal effects of chronic medications), efficacy and effectiveness of healthcare technologies (e.g. glycemic control and outcomes in patients treated with new generation therapies for diabetes), medical and economic burden of chronic diseases and health events (e.g. congestive heart failure, hepatitis C infections) as well as pharmacoepidemiology studies such as medication adherence studies (e.g. tamoxifen in breast cancer patients) and pleiotropic effects (e.g. statins). Our other interests include health effects of low dose ionizing radiation and specifically cancer and cataract.

Using Medical Databases for Personalized Medicine

Positions
Head, Maccabi Institute for Research & Innovation, Maccabi Healthcare Services
Associate Professor, Epidemiology & Preventive Medicine Division, School of Public Health, Tel Aviv University
Independent family practice partnership clinic, Rosh Haayin

Research
The emergence of precision medicine technologies has allowed medical scientists to address complex questions which necessitate very large datasets and patients’ numbers. Unlike traditional methods such as randomized trials, the richness of very large sets of data enables more rapid advance toward personalized medicine. At the Maccabi Institute for Research & Innovation, we utilize large real-world databases to investigate clinical issues for better provision of care and improved outcomes. In addition to traditional and pragmatical clinical trials, we conduct multiple observational analysis using advanced data platform to enable data science studies based on Maccabi’s database of 2.5M members' medical files. One example for personalized medicine is our newly developed method for identifying individuals at increased risk of harboring colorectal cancer by analyzing their complete blood counts records. We have developed a computational model using a large derivation dataset of over 450,000 Israeli individuals and validated it on 2 separate and independent datasets of primary care patients, consisting of over 139,000 Israeli and over 25,500 UK individuals. Our approach applies novel methods both in feature generation (where we use a set of linear models to handle sparse and irregular measurements along time) and in model construction (where we combined 2 tree-based models – RF and Gradient Boosting). We showed that our approach can detect 50% of CRC cases 3–6 months before diagnosis at 88% specificity in the Israeli dataset and 94% specificity in the UK dataset. The system is already successfully implemented in routine practice at Maccabi.

Research
Our laboratory’s aim is the molecular characterization of the ovulatory cascade in the human ovary. We undertook to systematically identify novel ovulation-associated genes. Differentially expressed candidate genes (n = 1746) were identified by comparing the transcriptome of cumulus granulosa cells from compact pre-ovulatory germinal vesicle (GV) cumulus oocyte complexes with those of expanded post-ovulatory Metaphase II COCs. We assumed that differentially expressed genes likely serve as regulators of ovulation, cumulus expansion, and/or oocyte maturation. To complete the identification of factors involved in the ovulatory process, we generated a library of global miRNAs involved in this process, and by bioinformatics tools link the ovulatory miRNA library with the mRNA library. The bioinformatics analysis enables us to identify new regulatory mechanisms responsible for the oocyte maturation process and ovulation.

The resulting database provides unprecedented insight into the processes and pathways involved in follicular maturation and ovulation. This effort led us to identify and characterize several new genes involved in the human ovulatory process such as sFRP4, ADAMTS-1, Decorin and Lumican. Recently, prompted by the observation that prostaglandin transporter (PGT) constitutes a highly expressed peri-ovulatory transcript, we set out to investigate the physiological role of this key transporter protein in the ovulatory process. We were able to show that PGT is an indispensable mediator of ovulation, the inhibitors of which may constitute potential novel candidates for non-hormonal contraception (Science Translational Medicine, 2016).

These studies will contribute significantly to the understanding of the complex process of ovulation in...
human which is central to the reproductive processes. The implications of improved understanding of this process may contribute to further development of strategies for in vitro maturation of oocytes and follicles, improve IVF success rates especially in difficult clinical conditions. Genes that their expression levels correlate with oocyte clinical outcome can be future markers for oocyte quality and selection. Elucidating new human ovulatory genes may contribute to our understanding of infertility conditions such as anovulation, and development of novel strategies for fertility control.

Positions
Fertility Preservation Center, Reproduction IVF, Division of Obstetrics and Gynecology, Sheba Medical Center and Tel Aviv University.
President, International Society for Fertility Preservation (ISFP) http://www.isfp-fertility.org/

Research
Our research center is specialized in fertility preservation. We have a fully equipped basic research laboratory, together with a large clinical database with a significant number of incoming patients. This makes our research center unique for high quality basic research with clinical relevancy. Our research focuses on:
- Ovarian follicle research and the biological clock.
- Cryopreservation / transplantation of ovarian tissue and IVF.
- The effects of toxic agents and chemotherapy on reproduction and gametes.
- Modalities and agents that protect the gametes and prevent toxic damage.
- Genetic injury to the gametes.
- Methods to detect cancer cells in tissue.
- Endometrial receptivity.
- Interpreting cancer patients’ information regarding endocrine, reproductive and psychological effects.

President, Israel Stem Cell Society

Research
Our laboratory takes a multi-disciplinary approach including genetics, genomics, molecular biology, biochemistry, and the development of preclinical human-mouse models to cast light on fundamental problems of kidney developmental biology, tissue regeneration, and cancer; while, at the same time, holding promise for novel disease therapies. Our central hypothesis is that normal and transformed tissue stem cells drive these processes and therefore we aim to discover such cells and study their molecular mechanisms. In the field of human kidney development and pediatric renal cancer (Wilms tumor), we have pioneered the identification and isolation of normal and malignant renal stem/progenitor cells and have shown how these novel cell types are of relevance to human disease; on one hand utilization of the normal stem cells in tissue repair and regeneration and on the other hand development of targeted therapy against cancer stem cells and tumor eradication. These bench discoveries have been fundamental to translation to bedside; our approach for tumor stem cell eradication has already sparked a multicenter clinical trial for the treatment of patients with relapsing Wilms’ tumors.

Publications

From Developmental Biology to Normal and Cancer Stem Cells to Novel Therapeutics

The cover illustration shows how single-cell clones emerge during development, maintenance, and repair to generate a multicolored kidney. Dekel and colleagues report that continued growth of the mammalian kidney in adulthood is performed by lineage-restricted clonal progeny that continuously add new epithelial cells to each segment of the kidney and are responsive to Wnt signaling. Lineage-restricted progenitors are also observed in development after renal epithelial induction and during acute renal injury. Rainbow mice, which express one of four alternative fluorescent reporters in each cell, allow genetic lineage tracing of individual clones.

Laboratory for the Research of Skin Disease

Positions
Senior Lecturer, Sackler Faculty of Medicine
Director, Pediatric Dermatology Service, Lili Hospital, Sheba Children’s Edmond Safra & Medical Center
Lab aMnager
Dr. Gil Leichner Ph.D.

Research
We study skin diseases with a focus on angiogenesis and lymphangiogenesis. Deficiency in development or function of the vascular or lymphatic vasculature causes various anomalies in humans, and active angiogenesis and lymphangiogenesis play a significant role in tumor metastasis. The presence of vascular anomalies can cause emotional and social problems. Moreover, some malformations are painful or even life-endangering. Current treatments for these diseases do not achieve optimal results. The goal of my research is to isolate and characterize the endothelial cells, the major cellular component of the vascular malformations in order to develop targeted therapy for these lesions. We apply cutting-edge technologies including molecular biology, and microarray analysis to characterize the molecular paths that regulate the endothelium development. Other areas studied in the lab are editing in psoriasis and Cutaneous graft versus host disease.

Isolation and characterization of endothelial cells from lymphatic malformations. FACS (A) and immunofluorescence analyses shows pure lymphatic endothelium phenotype with reduced expression of the differentiation marker CD31.
